

IEEE ICCE 2014

**2014 IEEE Fifth International Conference
on Communications and Electronics (ICCE)**

Pullman Beach Resort Da Nang
July 30 - August 1, 2014

WELCOME

Welcome to the 2014 IEEE Fifth International Conference on Communications and Electronics (IEEE ICCE 2014) integrated in a USB version.

ICCE is becoming a reputable biennial international conference series in the scientific community on the areas of Electronics and Communications recently. Following the past successful conferences, the fifth IEEE ICCE 2014 looks for significant contributions to various topics in communication engineering, networking, microwave engineering, signal processing and electronics engineering. The conference will also include tutorials, workshops, and technology panels given by world-class speakers.

At the conference, two hundred and twenty eight (228) papers from more than 30 countries have been submitted. Among these submissions, ninety six (96) regular full papers, which will be submitted for inclusion into IEEE Xplore and twenty nine (29) poster papers have been accepted for presentation and will be organized in 18 regular and 2 special sessions. The Opening Session will host 4 keynotes. Four tutorials offered by the conference widely cover the most interesting topics on electronics and communications engineering, whose issues related to Quality of Mobile Multimedia Experience, Immersive Visual Communication with Depth, Crowdsourcing, and Free Space Materials Characterization.

The technical program focuses on hot topics on the fields of Communications Networks and Systems, Signal Processing and Applications, Microwave Engineering, and Electronic Systems. Besides, the special sessions on Crowdsourcing and Crowdsourcing Applications, and on Information Hiding and Security in Communications: Recent Developments have been added to the technical program of this event.

Beside the printed proceeding, this edition in USB is designed for readers to locate the papers by session or authors. Papers are originated as electronic files and were converted to Adobe Acrobat PDF file format for a crossplatform access. Even though the viewing quality on your monitor may vary, all papers have been printed clearly.

Enjoy your reading through!

TABLE OF CONTENTS

PART A: FULL REGULAR PAPERS	1
I. Communication Networks and Systems	3
Fiber-Optic Communications 1	5
1. Rigorous Characterization of Nano-photonic Devices <i>B. M. A. Rahman</i>	6
2. Generation of FCC-compliant Ultra-wideband Waveforms Using Directly Modulated Semiconductor Distributed-feedback Laser <i>Quang Trung Le, Dieter Briggmann, Franko Kuppers</i>	12
3. A Study on Measuring Refractive Index by Using an Optoelectronic Oscillator <i>Toan Thang Pham, Isabelle Ledoux-Rak, Bernard Journet, Van Yem Vu</i>	17
Fiber-Optic Communications 2	23
1. Light Source Design Using Hollow Core Photonic Crystal Fibers <i>Md. Anwar Hossain, Yoshinori Namihira, Takuro Yasui, Nguyen Hoang Hai</i>	24
2. A 622 Mbit/s Transmitter for POF-based Home Networks using Red LED <i>V. D. Trong, P. H. Binh, T. C. Thang</i>	30
3. New Proposal of Chromatic Dispersion Control in Honey Comb Photonic Crystal Fiber for Broadband Communication <i>Nghiem Xuan Tam, Nguyen Xuan Son, Pham Hong Thai, Nguyen Hoang Hai</i>	34
Free Space Optical Communications	41
1. Performance of Free-Space Optical Communications Using SC-QAM Signals Over Strong Atmospheric Turbulence and Pointing Errors <i>Ha Duyen Trung, Do Trong Tuan</i>	42
2. APD-based Amplify-and-Forward Serial Relaying FSO Systems over Gamma-Gamma Channels <i>Thanh V. Pham, Ngoc T. Dang, Anh T. Pham</i>	48
3. Design and Performance Evaluation of VLC Indoor Positioning System using Optical Orthogonal Codes <i>Sari Yamaguchi, Vuong V. Mai, Truong C. Thang, Anh T. Pham</i>	54
4. Performance Analysis of Indoor MIMO Visible Light Communication Systems <i>Ngoc-Anh Tran, Duy A. Luong, Truong C. Thang, Anh T. Pham</i>	60
Wireless Communications 1	65
1. Clustered Precoding for Coordinated Multi-Cell Systems Based on Signal-to-Leakage Ratios <i>Mehdi Sadeghzadeh, Hamid Reza Bahrami, Nghi H. Tran</i>	66
2. Channel Estimation Method for SFBC MIMO-OFDM Based Wireless Two-Way Relay System in Time-Varying Fading Channel <i>Tanairat Mata, Kazuo Mori, Hideo Kobayashi, Pisit Boonsrimuang</i>	71
3. Optimal Power Allocation Schemes for Single-Relay AF Wire-Tap Channels <i>Leonardo Jimenez Rodriguez, Nghi H. Tran, Tho Le-Ngoc</i>	77
4. Coordinated Downlink Beamforming in Multicell Wireless Network <i>H. H. M. Tam, H. D. Tuan, E. Che</i>	83
Wireless Communications 2	87
1. A Proposed Iterative Decoder for ATSC Standard <i>Pham Hai Dang, Tran Minh Hai, Nguyen Tien Dung</i>	88
2. Symbol-Based Parallel Message-Passing Decoding on Partial-Response Channels <i>Wicharn Singhaudom, Pornchai Supnithi</i>	94
3. A Nonlinear Method of Multipath Mitigation for new GNSS signals <i>Hung Pham Viet, Chien Dao Ngoc, Khang Nguyen Van</i>	99
Wireless Communications 3	105
1. An OFDM-based Chaotic DSSS Communication System with M-PSK Modulation <i>Nguyen Xuan Quyen, Le Van Cong, Nguyen Huu Long, Vu Van Yem</i>	106
2. A Geometry-Based Channel Model for Shallow Underwater Acoustic Channels Under Rough Surface and Bottom Scattering Conditions <i>Meisam Naderi, Matthias Pätzold, Alenka G. Zajic</i>	112
3. Experimental Testing of Asymmetric Underwater Acoustic Networks <i>Usa Vilaipornsawai, Antonio Silva, Sergio M. Jesus</i>	118
Cognitive Radio	125
1. Receive Diversity in Cognitive Relay Transmission: Outage Analysis <i>Nguyen Hong Giang, Vo Nguyen Quoc Bao, Hung Nguyen-Le</i>	126
2. Cognitive AF Relay Assisting both Primary and Secondary Transmission with Beamforming <i>Thi My Chinh Chu, Hoc Phan, Hans-Jürgen Zepernick</i>	132

3.	BER Analysis of Underlay Relay Cognitive Networks with Imperfect Nakagami-<i>m</i> Fading Channel Information	138
	<i>Khuong Ho-Van</i>	
4.	On the Performance of Underlay Cooperative Cognitive Networks with Relay Selection under Imperfect Channel Information	144
	<i>Khuong Ho-Van</i>	
5.	A Game-theoretic Framework for Opportunistic Transmission in Wireless Networks	150
	<i>Ca Van Phan</i>	
Future Internet		155
1.	GENI: Large-Scale Distributed Infrastructure for Networking and Distributed Systems Research	156
	<i>Mark Berman, Chip Elliott, Lawrence Landweber</i>	
2.	Adaptive Video Streaming with Smooth Advertisement Insertion	162
	<i>Hung T. Le, Nam Pham Ngoc, Anh T. Pham, Truong Cong Thang</i>	
3.	QoS-aware Multi-Cloud Brokering for NGN Services: Tangible Benefits of elastic Resource Allocation Mechanisms	168
	<i>Thomas Magedanz, Florian Schreiner</i>	
4.	Monitoring as a Service for Cloud Environments	174
	<i>Julius Mueller, David Palma, Giada Landi, Joao Soares, Bruno Parreira, Thijs Metsch, Peter Gray, Alexander Georgiev, Yahya Al-Hazmi, Thomas Magedanz, Paulo Simoes</i>	
Software-Defined Networking		183
1.	OFCProbe: A Platform-Independent Tool for OpenFlow Controller Analysis	184
	<i>Michael Jarschel, Christopher Metter, Thomas Zinner, Steffen Gebert, Phuoc Tran-Gia</i>	
2.	Model of Organization and Distribution of Applications for Software Defined Networks: SDNrepo	190
	<i>Romulo S. Pinheiro, Billy A. Pinheiro, Antonio Jorge Gomes Abelem</i>	
3.	Running Lifecycle Experiments over SDN-enabled OF@TEIN Testbed	196
	<i>Aris Cahyadi Risdianto, Taeheum Na, JongWon Kim</i>	
Energy-aware Networking		199
1.	A Reliable Analyzer for Energy-Saving Approaches in Large Data Center Networks	200
	<i>Tran Manh Nam, Truong Thu Huong, Nguyen Huu Thanh, Pham Van Cong, Ngo Quynh Thu, Pham Ngoc Nam, Hoang Quoc Viet, Luong Dinh Tho</i>	
2.	GTP-based Load Model and Virtualization Gain for a Mobile Network's GGSN	206
	<i>Florian Metzger, Christian Schwartz, Tobias Hofffeld</i>	
3.	Including Energy Efficiency Aspects in Multi-Layer Optical Network Design	212
	<i>Steffen Gebert, David Hock, Matthias Hartmann, Joachim Spoerhase, Thomas Zinner, Phuoc Tran-Gia</i>	
Ad hoc and Sensor Networks		219
1.	An Efficient Method for Gathering Data Considering Energy and Delay Time on WSNs	220
	<i>Phat Nguyen Huu, Vinh Tran-Quang</i>	
2.	A Simple Method for Localization in Wireless Sensor Networks	226
	<i>Chuyen T. Nguyen, Yao-Win Peter Hong, Van Yem Vu</i>	
3.	Toward Commodity Wireless Multihop Access Networks	232
	<i>Quang Tran Minh, Kien Nguyen, Shigeki Yamada</i>	
4.	A Low Duty-Cycle XT-MAC Protocol for Target Tracking in Wireless Sensor Networks	238
	<i>Quan Nguyen-Trung, Thu Ngo-Quynh, Vinh Tran-Quang</i>	
5.	Group Steiner Tree Model for Energy Efficient Multicast in Duty-Cycle Wireless Sensor Networks	244
	<i>Nguyen Thai Duong, Son Hong Ngo, Huynh T. Thanh Binh</i>	
Network Infrastructure and Services		251
1.	Chaotic Ad-hoc Data Network - A Bike Based System for City Networks	252
	<i>Bernhard Isemann, Markus Gruber, Janki Grünberger, Christian Schanes, Thomas Grechenig</i>	
2.	A Tracking Area List Configuration Method to Mitigate Burst Location Updates	258
	<i>Satoshi Ikeda, Nobuharu Kami, Takashi Yoshikawa</i>	
3.	Hybrid Priority Schemes for the Message Scheduling for CAN-Based Networked Control Systems	264
	<i>Nguyen Trong Cac, Nguyen Xuan Hung, Nguyen Van Khang</i>	
4.	A New Technique to Enhance Accuracy of WLAN Fingerprinting Based Indoor Positioning System	270
	<i>Long Vu-Hoang, Hung Nguyen-Manh, Chinh Phan-Duy, Dung Le-Quang, Thanh Do-Van, Vinh Tran-Quang</i>	
II. Electronics Systems		277
DSP on FPGA		279
1.	FPGA Implementation of the Synchronization for IEEE 802.11n WLAN systems	280
	<i>Minh-Duc Nguyen, Viet-Tan Nguyen, Tien-Dat Nguyen, Xuan-Nghia Nguyen, Vu-Thang Nguyen, Vu-Duc Ngo</i>	
2.	Enhancement and FPGA Implementation of ANFIS Algorithm in Digital Image Processing	285
	<i>Truong Hoai Duy, Nguyen Van Cuong</i>	
3.	Design Space Exploration for a Single-FPGA Handwritten Digit Recognition System	291
	<i>Thang Viet Huynh</i>	
4.	High Throughput FPGA Architecture for Corner Detection in Traffic Images	297
	<i>Tung H. Dinh, Dao Q. Vu, Vu-Duc Ngo, Nam Pham Ngoc, Vu T. Truong</i>	

Smart Sensor & Analog Devices 1	303
1. Sub-threshold CMOS Voltage-Multipliers using Hybrid RF-Piezoelectric Energy Scavenging	304
<i>Nguyen Thanh Trung, Tao Feng, Philipp Häfliger, Shantanu Chakrabarty</i>	
2. Optimization of Piezoelectric Energy Harvesting Systems by Using a MPPT Method	309
<i>Xuan-Dien Do, Seok-Kyun Han, Sang-Gug Lee</i>	
3. A High Power Conversion Efficiency Rectifier with New Internal V_{th} Cancellation Topology for RFID Applications	313
<i>Dat Nguyen, Toan Nguyen, Long Nguyen, Guillaume Thenaisie, Loan Pham-Nguyen, Sang-Gug Lee</i>	
Smart Sensor & Analog Devices 2	317
1. A Zero Current Detector with Low Negative Inductor Current Using Forced Freewheel Switch Operation in Synchronous DC-DC Converter	318
<i>Ngan K. Hoang, Sang-gug Lee, Young-Jin Woo</i>	
2. The Voltage-mode with Triple-input Single-output Universal Biquad Filter Using DURCs and CCCIs	323
<i>Sorapong Wachirarattanapornkul, Boonchana Purahong, Vansia Chutchavong</i>	
3. Design of folded CCDs for Ultra High Speed Imaging	327
<i>Nguyen, H. D., Dao, V. T. S., Etoh, T. G</i>	
ASIC Design and Verification	331
1. MultiStage ASIC Implementation of the Mersenne Twister Pseudorandom Number Generator	332
<i>Thuy T. Le, Sricharan Narayanan</i>	
2. Design of a Parallel CAM-based Multi-Match Search System Using 0.18-μm CMOS Process	336
<i>Duc-Hung Le, Katsumi Inoue, Cong-Kha Pham</i>	
3. AHB-Master Controller Formal Compliance Verification	340
<i>Nguyen Son Lam, Nguyen Duc Minh</i>	
4. An Open Source Verilog Front-end for Digital Design Analysis at Word Level	346
<i>Minh D. Nguyen, Quan V. Dang, Lam S. Nguyen</i>	
Computer and Memory Systems	351
1. Hardware Modelling of Frequency Recovery in an Upstream Demodulator for DOCSIS 3.0	352
<i>Suresh Kalle, Francis M. Bui</i>	
2. Memory-Efficient Signature Matching for ClamAV on FPGA	358
<i>Tran Ngoc Thinh, Tran Trung Hieu, Hiroshi Ishii, Shigenori Tomiyama</i>	
3. Parallel Random Access Memory in a Shared Memory Architecture	364
<i>Tran Duc Linh, Tony de Souza-Daw, Thang Manh Hoang, Nguyen Tien Dzung</i>	
4. Magnetic Camera for Visualizing Magnetic Fields of Home Appliances	370
<i>Bui Anh Tuan, Anthony de Souza-Daw, Hoang Minh Phuong, Thang Manh Hoang, Nguyen Tien Dzung</i>	
III. Microwave Engineering	377
Multi-band and Wide-band Antennas	379
1. Compact Multi-band Antenna and Matching Circuit for LTE Low Frequency Bands	380
<i>Thanh-Nga Mai, Anne Claire Lepage, Bernard Huyart</i>	
2. Dual Band Hexagonal Microstrip Antenna Loaded with Hexagonal and Cylindrical EBG	385
<i>Karthikeya G. S, Shravan Kaundinya, Dr.Hariprasad S. A</i>	
3. Analysis and Design of Antipodal Vivaldi Antenna for UWB Applications	391
<i>Hien Chu Ba, Hiroshi Shirai, Chien Dao Ngoc</i>	
4. A Small Patch Antenna for GSM Applications	395
<i>Ngo Hoai Nguyen, Kieu Trung Liem, Nguyen Dinh Uyen, Doan Phuong Duy</i>	
Antennas and Propagation	399
1. Design of a Parallel Plate Slot Array Antenna Fed by a Rectangular Coaxial Line	400
<i>Jiro Hirokawa, Hajime Nakamichi, Makoto Sano, Makoto Ando, Katsumori Sasaki, Ichiro Oshima</i>	
2. Evolutionary Algorithm for Bandstop Frequency Selective Surface	404
<i>Linh Ho Manh, Marco Mussetta, Riccardo E.Zich</i>	
3. Diversity Property of Millimeter Wave Wireless Networks against Localized Rain	407
<i>Hung V. Le, Takuichi Hirano, Jiro Hirokawa, Makoto Ando</i>	
Microwave Components, Subsystems and Applications	411
1. Implementation of a Mobile Device for Complex Permittivity Measurement of Liquids Based on Microwave Resonant Method	412
<i>Anupan Phungasem, Kittipong Nuanyai, Nutdechatorn Puangngernmak, Suramate Chalermwisutkul</i>	
2. Material Choices of Honeycomb Structures and their Effects in mm-Wave RLSAs	417
<i>Tung Nguyen, Jiro Hirokawa, Makoto Ando, Osamu Amano, Shuichi Koreeda, Takaomi Matsuzaki</i>	
3. Design of A 10-MHz Low Phase-Noise Oscillator Using Second-Mode Face Shear Square Micromechanical Resonator	420
<i>Tan-Loc Nguyen, Mingzheng Pan, Yuan Ling, Zhipeng Li, Jingfu Bao</i>	
4. A Butterfly MMI Waveguides Based Polarization Beam Splitter Etched on SOI platform	425
<i>Cao Dung Truong, Duc Han Tran, Vu Chung Hoang, Trung Thanh Le</i>	

IV. Signal Processing and Applications	431
Image and Video Processing 1	433
1. Asymmetric Diamond Search Pattern for Motion Estimation in HEVC <i>Phong Nguyen, Hieu Tran, Hai Nguyen, Xuan-Nghia Nguyen, Cuong Vo, Binh Nguyen, Vu-Duc Ngo, Vu-Thang Nguyen</i>	434
2. Fast FPGA Implementation of YUV-based Fractal Image Compression <i>Thai Nam Son, Thang Manh Hoang, Nguyen Tien Dzung, Nguyen Hoang Giang</i>	440
3. Mapping Services in Indoor Environments based on Image Sequences <i>Quoc-Hung Nguyen, Hai Vu, Thi-Thanh-Hai Tran, Quang-Hoan Nguyen</i>	446
Image and Video Processing 2	453
1. Sparsely Sampled Functional Magnetic Resonance Imaging Using Low-rank and Sparsity Constraints <i>Hien M. Nguyen, Gary H. Glover</i>	454
2. A Proposed Adaptive Image Segmentation Method Based on Local Excitatory Global Inhibitory Region Growing <i>Trong-Thuc Hoang, Quang-Trung Tran, Trong-Tu Bui</i>	458
3. Triangulation of an Elevation Surface Structured by a Sparse 3D Grid <i>Van Sinh Nguyen, Alexandra Bac, Marc Daniel</i>	464
Signal Detection and Estimation	471
1. An Improved Noise Reduction Algorithm for Speech Signals using a Microphone Array <i>Van Binh Truong, Duc Minh Nguyen, Quang Hieu Dang</i>	472
2. Dual PTZ Cameras Approach for Security Face Detection <i>Duc X Tran, Tien D Nguyen, Hieu M Bui, Son T Nguyen, Hong X Hoang, Thanh C Pham, Tony de Souza-Daw</i>	478
3. An Analysis on Human Fall Detection Using Skeleton from Microsoft Kinect <i>Thi-Thanh-Hai Tran, Thi-Lan Le, Jeremy Morel</i>	484
4. Abnormal Event Detection Using Multimedia Information for Monitoring System <i>Do-Dat Tran, Thi-Lan Le, Thi-Thanh-Hai Tran</i>	490
V. Special Session on CrowdSourcing and Crowdsourcing Applications	497
1. A Context-Aware Approach to Microtasking in a Public Transport Environment <i>Shin'ichi Konomi, Wataru Ohno, Tomoyo Sasao, Kenta Shoji</i>	498
2. Cost Models of Quality Assurance in Crowdsourcing <i>Deniz Iren, Semih Bilgen</i>	504
3. Predicting Result Quality in Crowdsourcing Using Application Layer Monitoring <i>Matthias Hirth, Sven Scheuring, Tobias Hofffeld, Christian Schwartz, Phuoc Tran-Gia</i>	510
4. Is Affective Crowdsourcing Reliable? <i>Isabelle Hupont, Pierre Lebreton, Toni Maki, Evangelos Skodras, Matthias Hirth</i>	516
VI. Special Session on Information Hiding and Security in Communications: Recent Developments	523
1. Achieving Secure Chaotic Communication Using EKF-Based Embedded-Keys System <i>Jia-Hong Lin, Wei-Song Lin</i>	524
2. A Novel Fuzzy Approach for Phishing Detection <i>Ba Lam To, Luong Anh Tuan Nguyen, Huu Khuong Nguyen, Minh Hoang Nguyen</i>	530
3. A Discounted Stochastic Game Approach to Intrusion Detection in Wireless Ad Hoc Networks <i>Hussein Moosavi, Francis Minhthang Bui</i>	536
4. On the Resistance of Serpent-type 4 Bits S-boxes against Differential Power Attacks <i>Cuong Nguyen, Lai Tran, Khoa Nguyen</i>	542
5. Secret Key Management and Dynamic Security Coding System <i>Thi Huyen Trang Nguyen, Jean-Pierre Barbot</i>	548
6. Secret Information Transmission Scheme Using MIMO System <i>Takuma Takimura, Hideichi Sasaoka, Hisato Iwai</i>	554
7. Wireless Steganography using MIMO System <i>Keisuke Hokai, Hideichi Sasaoka, Hisato Iwai</i>	560
8. Implementation and Evaluation of an Hyperchaos-based PRNG <i>Abdelkader Senouci, I. Benkhaddra, A. Boukabou, K. Busawon</i>	566
9. Chaos-based S-box for Lightweight Block Cipher <i>Ta Thi Kim Hue, Thang Manh Hoang, Dat Tran</i>	572
PART B: POSTER PAPERS	579
I. Communication Networks and Systems	581
1. Dynamic Almost Blank Subframe Scheme for Enhanced Intercell Interference Coordination in LTE-A Heterogeneous Networks <i>A. Daeinabi, K. Sandrasegaran</i>	582
2. A Novel Channel Estimation Method for IEEE 802.11p <i>Chunfan Wei and David W. Lin</i>	588

3.	Numerical Calculation of Achievable Rates for Cognitive Radio with Dynamic Frequency Hopping Under Imperfect Spectrum Sensing	593
	<i>Duc-Anh Le, Hung V. Vu, Nghi H. Tran, Trung Q. Duong, Duy Ngo</i>	
4.	Multicell Transmission over Multiple Access Channel: Precoding and Postcoding	599
	<i>Vien Nguyen-Duy-Nhat, Hung Nguyen-Le, Chien Tang-Tan, Quang Le</i>	
5.	A Modified Multiple Modulus Algorithm for Blind Channel Equalization of High Order QAM Signals	603
	<i>Huy-Dung Han</i>	
6.	A Low Cost GPS Tracking System for Marine Monitoring, Search and Rescue (MSnR) Using Dual Tone Multi-Frequency (DTMF) for Analog Radio	608
	<i>Kieu Trung Liem, Nguyen Dinh Uyen, Doan Phuong Duy, Ngo Hoai Nguyen</i>	
7.	An Improvement of the Lp-Norm Method to Model Acoustic Shallow Water Channels	612
	<i>Xuan Thang Nguyen, Xuan Bach Tran, Van Duc Nguyen</i>	
8.	Performance of IEEE 802.15.8 Peer Aware Communications	617
	<i>Hyungsik Han, Woowan Wang, Jinwoo Kim, Hyuncheol Park, Hyungjin Kim, Sung Cheol Chang</i>	
9.	Peer List Sharing by Router Collaboration for P2PTV Traffic Localization	623
	<i>Hiep Hoang-Van, Takumi Miyoshi, Olivier Fourmaux</i>	
10.	Virtual Application Layer for Policy Management in Programmable Networks using NFV	629
	<i>Van-Giang Nguyen, Younghan Kim</i>	
11.	Security Analysis of Software Defined Networking Protocols-OpenFlow, OF-Config and OVSDB	634
	<i>Markus Brandt, Rahamatullah Khondoker, Ronald Marx, Kpacha Bayarou</i>	
12.	Performance Evaluation of Local Fast Failover on OpenFlow Switch	639
	<i>Kien Nguyen, Hoang Tran-Viet, Toan Nguyen-Duc, Quang Tran-Minh, Shigeki Yamada</i>	
II. Electronics Systems		643
1.	Three-Electrode Capacitive Sensor for Air-Bubble inside Fluidic Flow Detection	644
	<i>Nguyen Duc Hai, Tran Thi Thuy Ha, Vu Quoc Tuan, Pham Quoc Thinh, Chu Duc Trinh</i>	
2.	A Circuit Structure for MOS Only R-2R Ladder DAC Having Higher Linearity	650
	<i>Takumi Yomogita, Nobuyuki Sugii, Shiro Kamohara, Koichiro Ishibashi, Cong-Kha Pham</i>	
3.	Current Mode All-pass Filter using CDTA and Uniform Distributed RC	655
	<i>Atiya Khwanphrai, Supachai Klungtong, Virote Pirajanchai, Paitoon Rakluea</i>	
4.	A Digital Fast Soft-Start Control Method In DC-DC Converter For Smart Sensor Applications	659
	<i>Ngan K. Hoang, Sang-gug Lee, Young-Jin Woo</i>	
5.	Analysis of Stakeholder Concerns for Vehicle Navigation System Architecture Solution	663
	<i>Xiaoying Kong, Li Liu, Tich Phuoc Tran, Kumbesan Sandrasegaran</i>	
6.	Home Energy Management System using IPv6 IEEE1888 Networking	669
	<i>Duong Hoang Le, Pongpot Chaiboonruang, Wanchalerm Pora</i>	
III. Microwave Engineering		675
1.	Wide Bandwidth Vialess Composite Right/Left Hand Antennas in the UHF Band	676
	<i>Binh Pham, Jia-Chi Samuel Chieh, Anh-Vu Pham</i>	
2.	A Novel Quad Band Slot Antenna for GSM, LTE and WLAN Applications	680
	<i>Shravan Kaundinya, Karthikeya G.S, Dr. Hariprasad S.A.</i>	
3.	Radiation Characteristics of a Wearable Antenna with Woven Fiber Structure	684
	<i>Tien Manh Nguyen, Jae-Young Chung</i>	
4.	Non-Geostationary Satellite Antenna Tracking by means of Fuzzy Logic High Precision Control	688
	<i>Minh Quan Duong, Francesco Grimaccia, Marco Mussetta, Riccardo Zich, Kim Hung Le</i>	
5.	Secret Key Capacity of Secret Key Agreement Scheme Using Multiple Antennas	693
	<i>Naoki Iwamoto, Hideichi Sasaoka, Hisato Iwai</i>	
IV. Signal Processing and Applications		699
1.	Design of Video Equalizer for Chrominance Delay Distortions by using Hurwitz Polynomials and Linear Phase Approximation Technique	700
	<i>V. Chutchavong, S. Pongpayom, O. Sangaroon, K. Janchitrapongvej</i>	
2.	Recognition of Vietnamese Warning Traffic Signs Using Scale Invariant Feature Transform	706
	<i>Binh Quang Long Mai, Phuong Thi Dao, Huu Tue Huynh, Dong Anh Doan</i>	
3.	A Method for Efficient Environment Modeling in Pervasive Applications	712
	<i>Dinh-Van Nguyen, Trung-Kien Dao, Eric Castelli, Hung-Long Nguyen</i>	
4.	Direction of Arrival Estimation using the Total Forward - Backward Matrix Pencil Method	718
	<i>Han Trong Thanh, Vu Van Yem, Nguyen Duy Minh, Hoang Duc Thang</i>	
5.	A Signal Processing Method to Remove Environmental Effects for Damage Detection in Bridge Structures	723
	<i>Nguyen V.H., Mahowald J., Maas S., Golinval J.-C</i>	
6.	Reconstruction of Parametric Surfaces Using Inverse Doo-Sabin Subdivision Scheme	729
	<i>Le Thi Thu Nga, Nguyen Tan Khoi, Nguyen Thanh Thuy</i>	

An analysis on human fall detection using skeleton from Microsoft Kinect

Abstract— In this paper, we present a novel fall detection system based on the Kinect sensor. The originalities of this system are two-fold. Firstly, based on the observation that using all joints to represent human posture is not pertinent and robust because in several human postures the Kinect is not able to track correctly all joints, we define and compute three features (distance, angle, velocity) on only several important joints. Secondly, in order to distinguish fall with other activities such as lying, we propose to use Support Vector Machine technique. In order to analyze the robustness of the proposed features and joints for fall detection, we have performed intensive experiments on 108 videos of 9 activities (4 falls, 2 falls like and 3 daily activities). The experimental results show that the proposed system is capable of detecting falls accurately and robustly.

Keywords—Kinect sensor; Skeleton; Support Vector Machine

I. INTRODUCTION

Falls in elderly is a major public problem. Several studies have shown [1] that elderly people experience at least one fall every year. Moreover, falls are the main cause of accidental death in older adults aged 65 or more [2]. Therefore, fall detection has attracted a large attention of researchers as well as industrial. A huge number of material, equipment and fall detection methods have been proposed. Among these methods, vision based method has a great advantage because it does not require the elderly people to wear a specific equipment.

Recently, Kinect device has been released. The use of this sensor for health care application in general and fall detection in particular has two main advantages. Firstly, this sensor provides rich information (color, depth and skeleton) in comparison with conventional cameras and therefore gives a better representation of fall. Secondly, this device allows developing a solution for protecting privacy - major issue in health care application by using only depth and skeleton information.

In this paper, we present a novel fall detection system based on the Kinect device. The originalities of this system are two-fold. Firstly, based on the observation that using all joints is not pertinent and robust to represent human posture because in several human postures the Kinect is not able to track correctly all joints, we define and compute three

features (distance, angle, velocity) on only several important joints. Secondly, in order to distinguish fall with the others activities such as lying, we propose to use SVM (Support Vector Machine). The experimental results show that the proposed system is capable of detecting falls accurately and robustly.

The remaining of this paper is organized as follows. The section II gives a brief survey on vision-based fall detection approaches in general and Kinect-based fall detection in particular. Then, our proposed method is described in detail in Section III. Section IV presents experimental results as well as discussions. Finally, we give some conclusions and future works in Section V.

II. RELATED WORKS

The fall of a person can be described as the rapid change from upright/sitting position to the reclining or almost lying position. The fall is not a controlled movement like lying for example. According to [3], the fall may be divided into four phases: prefall, critical, postfall and recovery.

Over the last years, there are a number of works that have been proposed for fall detection. These works can be classified according to whether they focus on direct detection of the critical phase/impact shock or postfall phase. In this paper, we do not try to do an exhaustive survey of all state of the art works for fall detection that is the scope of the others papers [3]. We present a brief summary of vision-based fall detection. As our work is based on Kinect device, we try to analyze the related works for fall detection using Kinect.

Since Kinect device provides color, depth image and skeleton information. The Kinect-based fall detection work can be classified according information source. The works belonging to the first category explores color and depth information while the second category attempts to use skeleton information to detect the fall.

Concerning fall detection using depth information, Rougier et al. [4] introduce a Kinect-based fall detection system. In this system, a fall will be recognized using two parameters: the distance between subject's centroid and the floor and the velocity of the center of mass. In this work, the

floor is detected by a histogram analysis of a V-disparity image. In [5] (Fall Detection on Embedded Platform Using Kinect and Wireless Accelerometer), the authors combined Kinect and Accelerometer to detect the fall. Concerning fall detection based on Kinect, the authors detect the foreground object (person) by using differencing technique on depth images. After that, the center of gravity of the person and the distance between the person's gravity center and the altitude of the Kinect are calculated. Finally, the fall can be detected by applying predefined rules. This work cannot distinguish the fall and Activities of Daily Living (ADL) such as brutally sitting on the floor. In Mastorakis et al. work [6], the authors exploit color and depth information to build 3D (height, width, depth) bounding box of the subject. Thus, two velocities (velocity in height and velocity in depth-width) are computed in order to define the fall.

The work presented in [7] belongs to the second category. In [7], the authors developed two algorithms to detect falls using the skeleton information provided by Kinect SDK. The first algorithm uses only joint position data while the second one calculated the velocity of joints. Concerning the first algorithm, firstly the maximum distance of all joints with the floor is determined. Then, if this distance is smaller than a predefined threshold, a fall is recognized. The second algorithm computes the average velocity of all joints in several frame and determines the fall by comparing this average velocity with a predefined threshold.

III. PROPOSED METHOD FOR HUMAN FALL DETECTION

A. Kinect overview

Before describing the proposed method for human fall detection, we make a brief overview of Kinect for a better understanding of Kinect sensor, Kinect SDK, coordinate systems used in our work.

A Kinect device has 3 sensors: a standard camera that gives RGB image; an IR camera detects points projected by a laser and automatically converts them into a depth map; a microphone array. The Kinect SDK is a free software package that provides lots of useful tools to exploit information provided by Kinect. For example, in our work, we use 3D location of skeleton joints and floor plane equation.

When working with Kinect, we need to understand some reference coordinate systems (Fig. 1).

Fig. 1. (a) Depth space; (b) Skeleton space

1) Depth space

For each frame, the depth sensor captures a gray scale image representing the “depth” of things in the scene to the sensor. The value of each pixel is the Cartesian distance, in millimeters, from the camera plane to the nearest object at that particular (x, y) coordinate, as shown in Fig. 1a.

2) Skeleton space

For every frame, the depth image is processed by the Kinect runtime to convert into skeleton data. Skeleton data contains 3D positions of each skeleton joint is stored as (x, y, z) coordinates. Unlike depth space, skeleton space coordinates are expressed in meters. The x, y, and z-axes are the body axes of the depth sensor as shown in Fig. 1b.

B. Schema of the proposed system

The method for human activity classification that we propose is based on skeleton information of the human. Specifically, when the human performs a certain activity, the skeleton joints move. We characterize this movement by three features: the distance from each joint to the floor plane, the angle between the line linking a considered joint to the head joint and the normal of the floor plane, the velocity of each joint in the coordinate of the floor plane.

As each activity will be performed in a duration of time, normally, each activity will be represented by a sequence of three features set. The sequence length could change between activities and vary from one human to another. To simplify the activity representation, we will not take all values of angle, velocity, and distance in the sequence but we take only the most significant one of each feature type. In addition, only upper body joints are interesting to characterize fall activities. So in our paper, we propose to consider eight upper body joints as presented in the Tab. 1.

Each activity now is represented by a set of values (distance, velocity, angle) of several joints of human skeleton, that we call feature vector. Feature vectors will be inputs for training or testing Support Vector Machine (SVM) classifiers.

Fig. 2 shows different steps of the method. We will describe in more detail each step in the following sections.

- *Step 1:* Compute the floor plane of the room. This step is done one time at the beginning. Knowing the floor plane equation, we can compute the distance of any point (skeleton joint) to this plane.
- *Step 2:* Extract human skeleton. The Kinect SDK has proposed a tool to extract human skeleton. As in the section of Kinect overview, we will take 3D coordinates of each joint of human skeleton and convert into the coordinate of the plane floor.
- *Step 3:* Compute features of each joint (distance, velocity, angle) at every frame. Choose features that are most significant for activity representation
- *Step 4:* Classify activity using SVM model that we have learnt before using training dataset.

Fig. 2. Main steps of activity classification using skeleton information and SVM technique

C. Floor plane detection

As presented previously, the features used to recognize activities such as angle, velocity and position are all computed respect to the floor plane. Therefore first we need to determine floor plane. We have tried two methods for floor plane detection. One is based on V-disparity computation [4]. Another is based on plane equation already computed by Kinect SDK.

For V-disparity based method, we first compute the V-disparity image from depth map provided by Kinect. Then from V-disparity image, we apply the Hough transform to determine straight lines and choose one line having the depth appropriate to the depth of the floor plane in the scene.

Fig. 3. (a) Depth map of the scene; (b) V-Disparity image and floor line determination; (c) Mapping floor in the depth map: magenta pixels belong to the floor plane (best viewed in color) [4]

Alternatively, Kinect SDK has provided a solution to capture floor plane. Specifically, it gives 4 values of the floor plane equation. However, when we tested with our scene, we found that Kinect SDK gives usually a floor plane with a lot of false positives. V-disparity method gives more accurate floor plane but it has some drawbacks: (i) it does not give stable result; (ii) it takes time due to the Hough transform.

We will give analysis results in the experiment section using both methods of floor plane detection.

D. Feature extraction

Kinect SDK of Microsoft has provided 3D locations of 20 joints of human skeleton (Fig. 4) when the human is visible in the depth sensor's field of view.

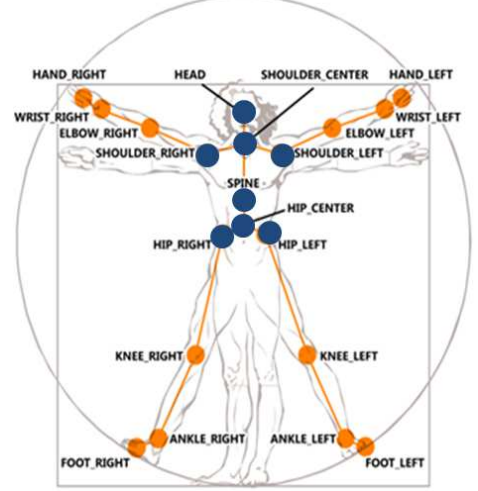

Fig. 4. 20 joints of human skeleton

However, all information is not pertinent in the framework of fall detection. In our proposed method, we consider 8 joints at most. These 8 joints (in blue color in Fig. 4) are combined to make 5 modes to experiment (Tab. 1).

TABLE I. DIFFERENT MODES FOR HUMAN FALL DETECTION

N0	Mode	Joints to be considered
1	1	Head
2	2	Head, Spine
3	4	Head, Shoulder Center, Spine, Hip Center
4	6	Head, Shoulder Center, Spine, Hip Center, Shoulder Right, Shoulder Left
5	8	Head, Shoulder Center, Spine, Hip Center, Shoulder Right, Shoulder Left, Hip Right, Hip Left

For each joint, we will compute 3 features: distance, angle and velocity (Fig. 5).

1) Distance

In our work, the distance of a joint is defined as the distance from this point to the floor plane. Given the floor plane equation, we can compute this distance easily.

$$d = \frac{Ax + By + Cz + D}{\sqrt{A^2 + B^2 + C^2}} \quad (1)$$

2) Angle

Angle of a joint is defined as the angle between the normal vector of the floor plane and the line linking the head joint and this joint.

3) Velocity

Velocity of a joint is defined as the difference of its positions at time t and time $t+1$.

Fig. 5. Computation of distance, angle and velocity of each joint

E. Learning activities

To model activities and recognize them, we proposed to use Support Vector Machine technique.

As we observe, an activity does not happen at a frame, but in duration of time. In addition, the duration of an activity can vary from one person to another. Therefore, for each activity, we will keep only one value of each considered joint of human skeleton: maximal velocity, minimal percentage of distance w.r.t the maximal distance, maximal angle. The size of descriptor vector equals to the number of joints in each considered mode.

As we work with 5 modes, we will learn 5 SVM classifiers.

IV. EXPERIMENTAL RESULTS

A. Dataset

To evaluate our proposed method, we must prepare dataset for training and testing. As we would like to detect fall event from normal activities of the person, we will define scenarios in which such that events appear. Based on studying state of the art on fall dataset, we propose to make 9 activities:

- 4 fall activities: fall back, fall front, fall right, fall left
- 2 fall like activities: sit and lie down the ground
- 3 daily life activities: walk, pick an object, sit down the bed

6 subjects aging from 20 to 35 years old are asked to make 9 scenarios twice in a room of size 3mx3m equipped with a bed (Fig. 6). If we mark 5 points on the ground, the trajectories to perform 9 scenarios are defined as in the Tab.2. Totally we have $9 \times 6 \times 2 = 108$ video clips. 54 clips for training and the remaining half for testing, but each test clips is tested 3 times.

Fig. 6. Experimental environment viewed from Kinect sensor and markers to perform scenarios.

TABLE II. SCENARIOS FOR ACTIVITY DATASET BUILDING

N ^o	Activity	Description
1	FallFront	S->A->Fall in the direction D
2	FallBack	S->A->Fall before arriving at D in your back in the direction of A
3	FallRight	S->A->Fall right after A in the direction C
4	FallLeft	S->A->Fall before arriving at C in your back in the direction of A
5	Sit	S->A->C->Sit down suddenly on the floor
6	Lie	S->A->C->Lie down in the direction of A
7	Walk	S->A->C->A and stay at A position
8	Pick	S->A Move to pick up an object, rise and stay at A
9	Sit	S->A->B-> Sit down and stay

B. Performance measurements

To evaluate the performance of our proposed method, we use two measurements: false positive rate (FP) and false negative rate (FN). Lower FP and FN are, better the system is.

C. Results

We will analyze the results of fall detection with the variation of types of features (distance, angle, and velocity), floor plane detection methods and skeletal modes (the number of used joints).

1) First experimentation: Analyze performance of three features with different modes and different floor plane detection methods

First, we prepare data for training and testing as presented above. Tab. 3 shows the obtained results with SVM technique. We notice that in all cases we do not obtain good values of false negative and false positive rates at the same time. In addition, as the angle value is quite unstable, the performance without using angle information is generally better. Beside, as the computation of floor plane using V-disparity method is not stable, the obtained result is worse than using Kinect SDK tools.

TABLE III. FIRST RESULTS OF ACTIVITY CLASSIFICATION (D: DISTANCE, V: VELOCITY, A: ANGLE)

Mode	Rate (%)	Floor detection method			
		Kinect		V-Disparity	
		{D, V, A}	{D, V}	{D, V, A}	{D, V}
1	FN	20	10	31	18
	FP	21	26	24	30
2	FN	18.06	8.88	31.11	17.78
	FP	13	24	24	28
4	FN	45	26	56.67	42.22
	FP	0	13.33	4.44	16.66
6	FN	45.56	14.44	51.11	16.67
	FP	1.1	4.4	5.6	7.8
8	FN	46.67	9.44	55.56	18.33
	FP	1.11	3.33	4.44	3.33

2) Second experimentation: Modify the training dataset

To understand why SVM does not give satisfying results, we look into the distribution of training examples of each feature type (Fig. 7). We can observe that for angle feature, the separation of negative and positive samples is very difficult. In addition, distance and velocity features are more separated, mostly at mode 2 and 4.

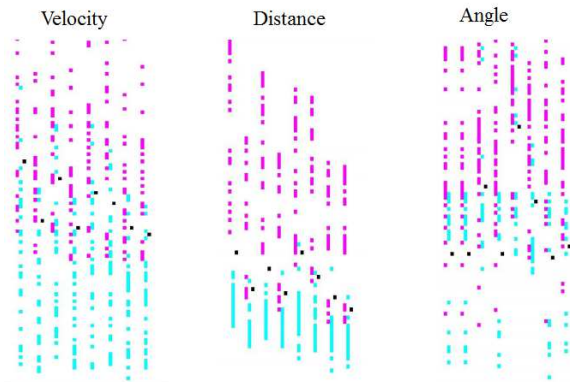

Fig. 7. Distribution of training examples for each feature type (left: velocity, middle: distance, right: angle) at each joint (from left to right in each column: Head, Shoulder Center, Spine, Hip Center, Shoulder Right, Shoulder Left, Hip Right, Hip Left) (best viewed in color). Magenta: negative samples (non-fall activities), Cyan: positive samples (fall activities). Black points represent the thresholds for classification.

Fig. 8. Removing some fall-like examples gives better separation on training set (with velocity feature).

Fig. 9. Removing some fall-like example give better separation on training set (with distance feature). Points inside the circle represent activity “sit suddenly on the floor”.

Therefore, in the second experimentation, we will analyze two best modes (mode 2 and mode 4) using SVM technique for learning and SDK Kinect for floor plane detection. This time, we will look more detail into SVM representation at mode 2 for example. The separation line between positive set and negative set is not correct because of some fall-like samples (see Fig. 8, Fig. 9). We then remove them and re-learn SVM classifiers. The separation

on the training dataset is now better. We will see if this gives better results on the test data.

TABLE IV. RESULTS AFTER RETRAINING SVM CLASSIFIERS

Rate (%)	Mode (using only Distance and Velocity feature)			
	2		4	
	FN	FP	FN	FP
	0.0	18.0	0.0	41.11

We can observe that with the new training there is no false negative, so it is very interesting result. But the false positive rate is still quite high (Tab. 4). Look into test results, we found that the activity “Lie down the floor” is often classified as fall activity.

3) Third experimentation: Analyse variation of distance and velocity features

As the activity “Lie down the floor” is frequently classified as fall activity, we will analyze in more detail the characteristics of these two activities in order to improve the performance.

We found that there is a strong variation on the velocity and distance in both activities (“Lie down the floor” and “Fall”) (Fig. 10). However, the transition time in case of “Lie down the floor” is longer. Therefore, we propose to take this observation to avoid the false positives.

Finally, we test the mode 2 and mode 4, using 2 types of features (distance and velocity) and with the time duration for fall is limited to a threshold (0.7s in our experiment) we obtain a very good result.

TABLE V. RESULTS WITH TIME DURATION OF ACTIVITY IS TAKEN INTO ACCOUNT

Rate (%)	Mode (using only Distance and Velocity feature)			
	2		4	
	FN	FP	FN	FP
	0.0	3.3	0.0	27.7

We found that this time no false negative is found and there are only 3.3% false positives at mode 2 (Tab. 5).

V. CONCLUSIONS

In this paper, we have presented a method for human fall detection based on skeleton information. An analysis on different modes (combination of skeleton joints), different feature types (angle, distance, velocity) has shown that using mode 2 (combination of 2 joints: head and spine) with two types of features that are distance and velocity give the best results. Angle feature is very sensitive so it is not recommended to be used. In addition, to avoid false positive, almost to distinguish fall-like activity (“Lie down the floor”) we should take transition time into account. The experimental results have been done with a dataset of 9 activities performed by different nationalities subjects. Compared to the works in [4], we worked with more challenge dataset. [4] uses only thresholding technique to detect fall so it is difficult to generalize with another dataset.

In the future, we will test and compare our method with more data and deploy it in a system to help elderly people.
